Remarks:

- \bigcirc Channels optional from 55-111, channel of base station, all beltpacks and Tally should be same.
- 2 Password of base station, all beltpacks and Tally should be same.
- ③ Scene level(background sound level) default "1", for most scene.
- \bigcirc Suppression level default "2".
- 5 Tally: you can choose Switcher and Switcher model according to the actual switcher that will be used.
- ⁶ Echo function: no supported by BS180.
- \bigcirc Echo cancellation: no supported by BS180.
- [®] RF power: changing is not recommended.

You need to install the drivers first time, and then when you will change the settings from 2-nd time, you can start from 6th setp of the struction.

Common questions:

1. Port number won't be found on Device manager after connecting base station and computer with the cable.

Solution: 1) Bad USB interface of computer, so you can try another USB interface.

- 2) Computer had not been restarted after installing the driver.
- 3) Incorrect cable was used.
- 2. Driver installation is not successfulSolution: system 32 bit should be changed to 64 bit W7 or W10.
- Port number on device manager with exclamation mark.
 Solution: 1) Built-in driver on computer was used, W 10 usually with this problem,
 so its better to change to W7.
- 4. When setting tool is opened, failed to open the port.Solution: the port is used by other software, so this software should be closed.
- 5. When setting tool is opened, click "set" but not successfully.Solution: 1) Restart the base station, after seeing successful connecting change the settings.

2) Incorrect port selected, so you need to choose the port once again.
